

Student Record Management System (C Project)

Abstract

The Student Record Management System is a simple C-based application designed to store and manage student information efficiently. The system allows users to add and display student records using file handling techniques. This project demonstrates the use of structures and file operations in C programming.

Introduction

Managing student records manually is time-consuming and prone to errors. This project provides a simple digital solution using the C programming language. It helps in organizing student data such as ID, name, and marks in a structured way.

Algorithm

- 1 Start the program
- 2 Display menu options
- 3 Accept user choice
- 4 If choice = Add → take student details and store in file
- 5 If choice = Display → read and show all records
- 6 Repeat until user selects Exit
- 7 Stop

Flowchart

Methodology

- 1 Programming Language: C
- 2 Concepts Used: Structures (struct), File Handling (fopen, fprintf, fscanf)

- 3 Data is stored in a text file (students.txt)
- 4 Menu-driven approach is used

Results

- 1 The program successfully adds student records
- 2 It stores data in a file permanently
- 3 It displays stored records correctly

Conclusion

The project demonstrates how file handling and structures can be used to manage data efficiently in C. It is simple, effective, and useful for beginners to understand real-world applications.

Future Enhancements

- 1 Add search functionality
- 2 Add delete/update options
- 3 Use GUI (Graphical Interface)
- 4 Connect to database
