

Student Records

C project: file-based student record management

Introduction

A simple *Student Record Management System* written in **C** using file handling to store and retrieve student data.

Automates manual tasks for faster, error-reduced record keeping and easy data access.

01 Overview

Abstract summary

A lightweight system that stores student details in *students.txt*, supports add, view, update, and delete operations.

Uses **structures** and **file handling** to persist records and retrieve them reliably.

Problem statement

Manual record keeping is slow, error-prone, and hard to search.

This project provides an automated, console-based solution for straightforward student data management.

Key conclusion

A compact *Student Record Management* tool in **C** that automates manual record tasks.

Reliable file-based storage and basic CRUD operations make it suitable for beginners and small-scale use.

02 Implementat ion

Algorithm steps

Start program and display menu options.

Get user choice, perform the selected operation (add/view/update/delete), and persist changes to file.

Loop until user exits.

Technical details

Implemented in **C** using *structures* to model student data.

File handling with *students.txt* for persistent storage and simple text parsing for records.

Console-based I/O and linear search for lookups.

Results validation

Records written to *students.txt* after add/update/delete operations.

Viewing displays parsed records correctly.

Basic manual tests confirm data integrity and expected behavior.

Conclusions

Simple, efficient, and educational: demonstrates structures and file I/O in C.

Ready as a beginner project or classroom example.
